Problem in Non Functional Programming

given three numbers
a, b, and c.

```
public static void main () {
```

```
    int sum1 = 0, sum2 = 0, sum = 0;
```

```
    while (a > 0) {
```

```
        sum1 += a % 10;
```

```
        a /= 10;
```

```
    }
```

```
    SOP (sum1);
```

```
    while (b > 0) {
```

```
    {
```

```
        sum2 += b % 10;
```

```
        b /= 10;
```

```
    }
```

```
    SOP (sum2);
```

```
    while (c > 0) {
```

```
        sum3 += c % 10;
```

```
        c /= 10;
```

```
    }
```

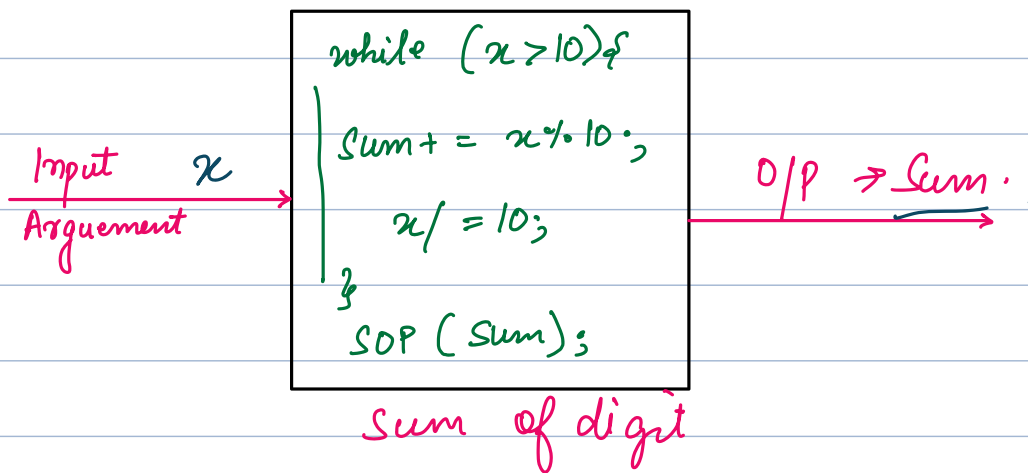

```
    SOP (sum3);
```

```
}
```

Issues in above Code?

- ✓ Redundancy.
- ✓ Readability.
- ✓ Maintainability.

BLACKBOX

Syntax of function

```
ansType function Name (inputType input) {  
    //Main logic  
    return ans;  
}
```

function to add two numbers.

```
int intSum (int a, int b) {  
    int sum = a+b;  
    return sum;  
}
```

function to print "Hello World"

```
void print Hello () {  
    System.out.print ("Hello World");  
}
```

Quiz 1.

```
public static int sum (int a, int b){  
    return a+b;  
}
```

15

10

$$15 + 10 = 25$$

```
public static void main (String [] args){  
    int a = 15, b = 5;  
    System.out.println (sum (a, 10));  
}
```

⇒ 25.

Quiz 2

```
public static int sum (int a, int b){  
    return a+b;  
}
```

```
public static void main (String [] args){  
    int a = 15, b = 5;  
    sum (a, b) - -  
}
```

Quiz 3

```
public static int sum (int a, int b){  
    System.out.print(a+b);  
}
```

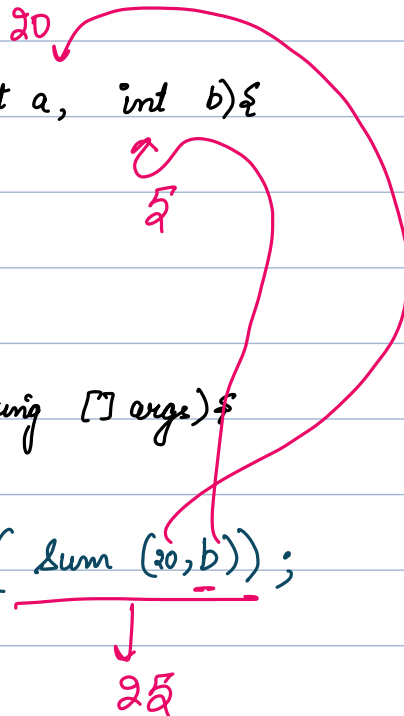

_____ X belum selesai

```
public static void main (String [] args){  
    int a = 15, b = 5;  
    sum (a,b);  
}
```

Quiz 4

```
public static int sum (int a, int b){  
    return a+b;  
}
```

```
public static void main (String [] args){  
    int a = 15, b = 5;  
    System.out.println (sum (20, b));  
}
```

→ 25 ,

Quiz 2

```
public static int sum (int a, int b){  
    return a+b;  
}
```

Handwritten annotations: 6 under `a`, 10 under `b`, and 16 under `a+b`. A pink arrow points from 16 to the `sum(6,10)` call in the `main` method below.

```
public static void main (String [] args){  
    int a = 15, b = 5;  
    System.out.println (sum (6,10));  
}
```

Handwritten annotations: 16 under `sum(6,10)`. A pink arrow points from 16 to the `sum(6,10)` call in the `main` method above.

Question 1.

Given an integer N , return whether the integer is even or not

Input 1 : 12 \rightarrow True

Input 2 : 5 \rightarrow false

```
static boolean isEven ( int n ) {  
    if (n%2 == 0)  
        return true ;  
    else  
        return false ;  
}
```

Question 2.

Given an integer N , return whether its height is small, medium or large

- If it is less than 10, then its small
- If it is b/w 10 to 20, then its medium
- If it is greater than 20, then large

Input: 5 \Rightarrow Small

Input: 51 \Rightarrow large

```
static String height ( int n ) {  
    String result = " ";  
    if ( n < 10 )  
        result = "small";  
    elseif ( n < 20 )  
        result = "medium";  
    else  
        result = "large";  
    return result;  
}
```

Question 3.

Given two doubles as argument, return the area of rectangle

Input : $a = 1.0$
 $b = 2.0$

2.0

static double area (double a, double b) {

 return a * b;
}

Question 4.

Given radius (double) of circle, return the area of circle

Input \rightarrow 7.0

$$\pi \times r^2$$
$$3.14 \times 7 \times 7 \Rightarrow \underline{154.0}$$
$$\underline{154.}$$

$$\pi \times r \times r$$

\downarrow

$$3.14$$

\downarrow

Math.PI

Static double areaOfCircle (double radius) {

return (Math.PI * radius * radius);

}

Question 2.

Given an integer N as an input, print all prime numbers b/w 1 to N .

Input : 10

1 to 10

2 3 5 7

Static boolean isPrime (int n) {

int factors = 0;

for (int i = 1; i <= n; i++) {

if (n % i == 0) {
factors ++;

}

if (factors == 2)
return true;

else

return false;

}

```
static void primeNumbers (int n) {
```

```
    for (int num=1; num<=n; num++) {
```

```
        if (isPrime (num)) {
```

```
            System.out.print (num);
```

```
        }
```

```
    }
```

```
}
```
